

Example: "1 pinnk" is the starting space. The target space is " 2 whifite". Each player tries to space After a short time, Roland calls out "5!" His route solution is: He moves the robot from His route solution is: He moves the robot from
" 1 pinck" "o " 6 pinklk", after that, " 6 whitite",
 " 6 red" and " 2 red" follow. From there, he reaches the " 2 whonitite" target space. He needed
five moves overall. Roland obtains the victory point chip from the target space. The starting chip is then put on " 2 white". The next player determines the new target space by rolling the dice and puts one victory point chip on the space. A new round can begin.

## SUGGESTION

After a few rounds, players can agree on not putting a victory point chip on the target space after rolling the dice. Instead, each player reads the target space directly from the dice. This way, all players can start figuring out a solution route immediately after the roll.

## VARIANT FOR EXPERTS

After the target space has been determined by dice roll and the victory point chip has been placed, the dice are rolled again. Both dice need to remain clearly visible to all players. They indicate the intermediate target space that the robot has to pass through on his route to the target space. The intermediate target doesn't get a victory point
chip. If the same starting space or target space is rolled again, players keep rolling until a different space comes up. Now the players have to try to figure out a route that first leads to the intermediate target and then to the target space.

## VARIANT FOR "RICOCHET ROBOTS"

This variant requires the "Ricochet Robots" game. The transparent robot comes into play as an additional robot, and the starting chip serves as a position marker for him. The transparent robot has to observe the same movement rules as the other robots, with the following addition: As usual, he through the wall, which costs one additional move. The walls
 round the centrepiece and at the edge of the playing area are excluded from this rule. He may not move through other robots. As usual, he may be used by other robots as an obstacle. If the "coloured vortex" is the current target chip on the centrepiece, the obstacle, the player cal also be moved to the target space. Wrobot bounces off or moves through it; but if the robot moves through it, this costs him an additional move.

We thank the unforgotten Alex Randolph, whose wonderful classic "Ricochet Robots" served as an inspiration for this game.

AB ABACUSSPIELE

A fast-paced mind-puzzle game for 2 to any number of players 8 years and up
The control computer has failed and has to be repaired. All the warning lights are lashing and the repair robot lurches across the mainboard. Players need to help him reach the damaged spots. Who will be the first to find the way to the next target?

## GAME COMPONENTS

1 transparent robot

## 1 colour dice

1 number dice
4 gameboard sections (black on the front copper-coloured on the back
1 transparent starting chip 25 transparent victory point chips

## GAME IDEA

Each round, players try to mentally figure out a route for the robot. Starting from his current position, the robot has to reach a target space as determined by dice roll. Finding he shortest route is not what matters - but coming up with a solution as quickly as possible is. The first player to do so obtains one victory point chip. Whoever is the first to accumulate five victory point chips wins the game.

## SET-UP OF THE GAME

First, agree on playing either on the black side or on the copper-coloured side of the gameboard sections. All parts
need to show the same colour. ed to show the same colou
Put the 4 gameboard sections together so that a square playing area of $6 \times 6$ (i.e., overall 36 ) in any way you want in any way you want.
Place the completed playing area in the middle of the table, easily visible to all players.
Set the two dice the robot and the starting chip out ready, next to the playing area. Put the 25 victory point chips next to that as a general supply.
Before the first round, the youngest player rolls both dice in order to determine the starting space of the robot:
Each space of the playing area is clearly determined by its combination of a number from 1 to 6 and one of the colours (blue, yellow, green, red, plink or whifies). Each combination of number and colour exists only once in the playing area.

## Example: "" $\bullet$ and "pink" $\bigcirc$ determine the "1 piolk"starting space

 The starting chip is placed on the corresponding space. For the time being, the robot staysnext to the playing area for a better overview. Later on, the robot will be used to check next to the playing area for a better overview. Later on, the robot will be used to check
the route solution. After that, the player re-rolls the two dice in order to determine the the route solution. After that, the player re-rolls the two dice in order to determine the
first target space. If he rolls the starting space again, he keeps rolling until a different space comes up. A victory point chip is placed on the target space. The first round can begin.

## COURSE OF THE GAME

Once the target space has been determined, the round begins. Simultaneously, al players try to figure out in their mind a route for the robot to get from the starting space to the target space. The following movement rules have to be observed

1. The robot may move only horizontally or vertically
2. The robot may move only to a space that matches either the colour or the number of his starting space. This does not necessarily have to be the closest matching space. Each move from one space to another space counts as one move.

Example: The starting chip is lying on "pindk". In this case, you have three possibilities for your first move. The obot can move in a vertical direction "due" or "yellow"; in a horizontal direction, he can move to " 6 piolins. You For your next move you have the For your next move, you have the
choice between " 6 blue" or " 6 whitite" in a horizontal direction or " 4 pionk" in a vertical direction, and so on.

This way, each player determines the robot's route in his mind, move after move, until the robot reaches the target space. As soon as one player has figured out a solution, he announces he thinks is required. He takes the robot and space in the number of moves he has announced

If the player manages to get the robot to the target space in the exact number of moves he has announced, he obtains the victory point chip from the target space. He puts it in his personal supply in front of him. For now, the robot remains on the target space. If the player does not reach the target space in the exact number of moves he has announced, he has to give one victory point chip from his supply - if possible - to the
player with the currently fewest victory point chips. If there are several players with the player with the currently fewest victory point chips. If there are several players with the order gets the chip. In any case, the robot is put on the target space and the victory point chip lying there is put back into the general supply.
After that, the round ends and a new round is prepared: The robot is replaced by the After that, the round ends and a new round is prepared: The robot is replaced by the
starting chip and put back next to the playing area. With this, the target space of this starting chip and put back next to the playing area. With this, the target space of this
round becomes the starting space for the new round. The last player to have rolled the dice passes them to his left neighbour; that player rolls the dice to determine a new target space, as described above under SET-UP OF THE GAME. He puts a victory point chip on the target space and the new round begins.
Special case: In case none of the players has figured out a route solution after 2 or Special case: In case none of the players has figured out a route solution after 2 or
3 minutes, we recommend that players agree on interrupting the current round and 3 minutes, we recommend that players agree on interrupting the current round and
determining a new target space by rolling the dice. The victory point chip is relocated from the old to the new target space and play continues.

## END OF THE GAME

The game can end in one of two ways:
A) One player obtains his fifth victory point chip. He is the winner of the game
B) All 25 victory point chips have been distributed. The player with the most victory point chips wins the game If there is more than one player with the most victory point chips, the players involved in the tie share the victory.
